

+ returned peak, on target + returned peak, on vessel ○ 3-mm target zone --- 14-mm mask

(e) One readout, four vessel gains

Each 6-mm window, affine background removed:

$$z \approx g\,u + h\,t, \quad h \geq 0$$

observed = gain × forecast + lesion template

CT only	$u = 0$
Fixed	$g = 1$
Plug-in	$g = g_0$ (null fit)
Joint profile	fit g, h together

Shared templates, search and classifier
→ accept crop? (10% FPR) · where is the peak?
